

Step 1 :

Open Lovable platform using lovable.dev/

Go to the “+” icon → “Integrations” → “Manage Integrations” → Find “Lovable Managed” under “Integrations” and **disable** both “Cloud and AI”.

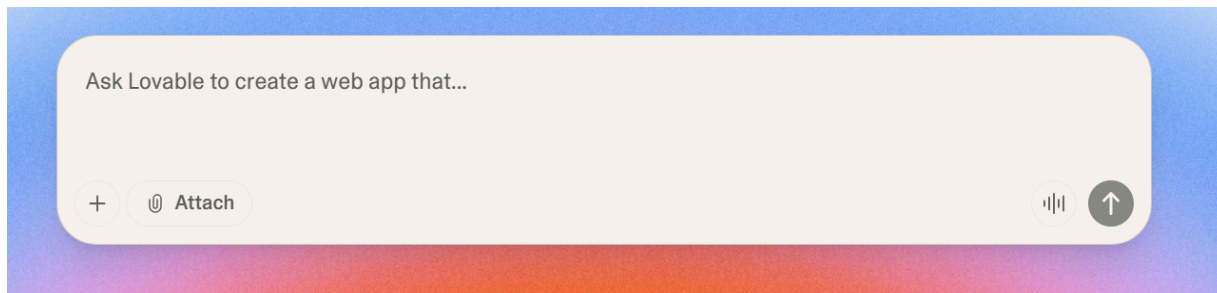

Why We Disable “Lovable Managed Cloud & AI”

When you turn off *Lovable Managed Cloud & AI*, you’re simply telling Lovable to focus only on generating the **front-end design** first.

This helps you get the layout and look of the app ready before adding backend features like uploads, limits, authentication, and logic. It makes the early building process smoother, faster, and easier to control.

Step 2 :

Enter the **Prompt** here -

“Create an ideal clone of calendly (meeting scheduler)

- 1) It should have authentication for user signup / sign-in
- 2) Allow users to create a meeting link by adding their available times
- 3) Show them link and allow other users to book meeting and show only those slots which are available or not booked by anyone
- 4) In free plan user can only create 1 link, in pro plan (9.99 usd) allow to create 3 links, in pro plus plan (19.99 usd) allow to create 5 link

I will provide you my stripe secret key and product id's
Also, store all details in Supabase”

It is Ideal to Build Only the Front End First

Starting with just the front-end allows you to shape the look, feel, and user flow of your app before adding functionality. It's easier to fix design or layout issues early, and once the visuals are correct, connecting the backend becomes simple and structured.

Step 3 :

Once we have the look ready of our application, check if the buttons are working. If Not, then use this **Prompt** -

“I am not able to upload documents or record any audio. Please check and fix the build errors.”

// How to Check If Buttons Are Working

Click on the upload button, menu options, or any interactive part of the app.
If nothing happens, the screen doesn't respond, or the file picker doesn't open, it means the button hasn't been connected yet → which is normal in early builds.

Step 3 :

Once we have the look ready of our application. Enter the next **Prompt** -

“After creating the link when I clicked on the view link, it showed Meeting Link Not Found The meeting link you're looking for doesn't exist or has been disabled.

Yes, please implement Stripe integration.”

// Your Output May Look Slightly Different

Your screen or layout may look a bit different from the examples in this guide, and that's completely normal. Each Lovable build is slightly unique, but the structure, features, and steps will match the tutorial.

If Lovable Gets Stuck (Quick Fix)

If Lovable stops responding or freezes:

- Refresh the page
- Reopen your project
- Re-enter your last prompt

Your work is always saved automatically, so nothing will be lost.
