

STRIPE INTEGRATION → Adding Payments to Your App

Now that your app is working with backend features and user accounts, the next step is enabling payments. Stripe is one of the easiest ways to let users upgrade their plan, buy credits, or subscribe to Pro/Pro Plus tiers.

Below is the complete step-by-step guide your learners can follow.

Step 1 :

Create Your Stripe Account

Go to <https://dashboard.stripe.com/>

- Sign up or log in
- Verify your email
- Complete basic profile details

Why this step matters:

Stripe needs your business details before allowing you to accept payments.

Open the Stripe Dashboard

Once logged in, you'll see the main dashboard.

This is where you can create:

- Products
- Prices
- Payment links
- Customer subscriptions
- API keys

Create Your Products & Pricing

You already created Free / Pro / Pro Plus tiers inside Lovable.
Now we make matching versions inside Stripe.

Do this:

1. Go to **Product Catalogue** in the left menu
2. Under **All Products** you will find **Create Products**
3. Create two simple products:
 - **Pro (monthly)**
 - **Pro Plus (monthly)**
4. For Pro and Pro Plus → Add a **Recurring price** (monthly) with the amount you want.

Tip : Pricing doesn't have to be final now. You can change it anytime later.

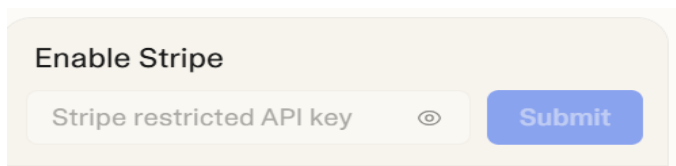

Get Your Stripe API Keys

To connect Stripe with your app, you need two keys.

Go to:

Home → **Secret Key** [used on the backend (Lovable handles securely)]

Important : Never share your Secret Key publicly or in the prompt. Enter only in the placeholder Lovable provides you with (like below)-

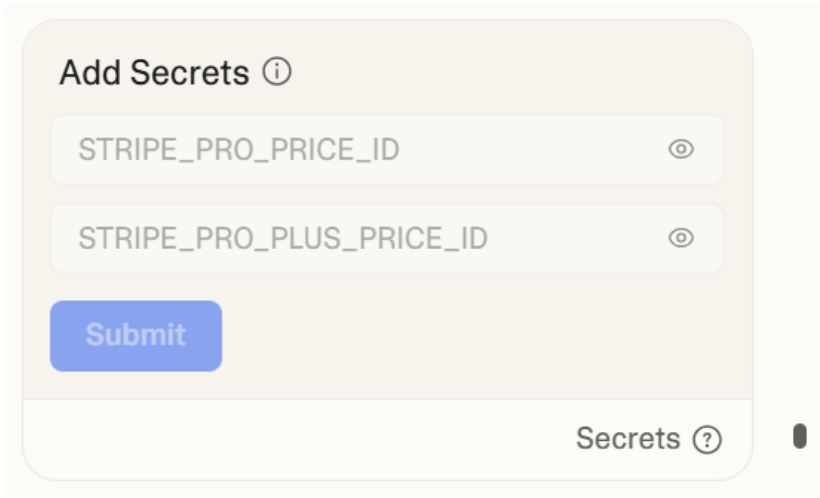

Enable Stripe

Stripe restricted API key 

Submit

And when needed to share the Price IDs of your subscription plan, ONLY add in placeholders like below -

Step 2 :

Next add this **Prompt** :-

“Now I want to integrate Stripe for payment purpose”

Output -

 New business sandbox

 Sandbox

Subscribe to Pro Plan - Audio Transcription

US\$9.99 per month

4 audio transcriptions per month with AI-powered summaries and action items

Pay with  link

 amazon pay

OR

Email

team@1learnai.com

Payment method

☐  Card    

☐  Cash App Pay

☐ Save my information for faster checkout
Pay securely at New business sandbox and everywhere link is accepted.

Subscribe

Step 3 :

Test Your Payments (Important)

Stripe has a Test Mode.

Make sure Test Mode is ON →
Top-right toggle inside the Stripe dashboard.

Then use Stripe's test card:

Card Number: 4242 4242 4242 4242

Any future expiry date

Any 3-digit CVC

Any name & postal code

Try upgrading your dummy user:

- Free → Pro
- Pro → Pro Plus

Everything should show inside: Stripe Dashboard → Payments → Test Mode

Output :

Check if you're landing on this page and if all functions are working smoothly -

Billing > Payment method

Add payment method

Card

Cash App Pay

Amazon Pay

Card number

1234 1234 1234 1234

Expiry date

MM / YY

Security code

CVC

123

Country

India

▼

By providing your card information, you allow New business sandbox to charge your card for future payments in accordance with their terms.

Add

Step 4 :

Troubleshooting & Debugging Stripe

If there's any error occurring then re-frame your prompt according to the error like we faced the following error for which we wrote this **Prompt** :

“after payment its redirecting me to
<https://cae6ebf8-3d24-4e75-8570-565906b8426f.sandbox.lovable.dev/>

Also it only shows loading animation when the page is refreshed or redirected after payment, please solve this time, and also, it is not updating the plan”

Step 4.1 :

Troubleshooting & Debugging Errors :

If there's any error occurring then re-frame your prompt according to the error like we faced the following error for which we wrote this **Prompt** :

“create all new functions related to payment - their name must be start with calendly_
dont delete current one, but you not have to use current checkout create function, create new with calendly_create_checkout

All those functions must be visible in my supabase edge functions in my dashboard”

Next according to the errors you get → frame **Prompt** like this :

“When I'm trying to upgrade to the Pro version it is giving me this error " Failed to start the checkout process. Please try again"

Please fix this issue and check all the build errors so that the app should work very smoothly.

Also please add a "Manage Subscription" button on the top from where the user can have the option to change their current plans.”

Step 4.2 :

When framing your **Prompts**, break it into smaller points to make the context easier for Lovable so that it can address all errors and resolve it in one go-

“The upgrade button is working but there are still few issues that you need to check and fix-

1. When I'm trying to upgrade the plan it takes my card details and processes it but even after changing the plan, The free he's getting reflected as the current plan and it is not even updating on the top where the current plan should be reflecting once upgraded.
2. After booking the meeting it took all the user details but any meeting is booked which is reflected in the calendar Nor did I receive any email whereas I am getting a notification on the platform that confirmation email has been sent.
3. There is no generated which the user can refer to join the meeting

Check thoroughly all these errors and fix all of it so that the app can work smoothly.”

Step 5 :

Troubleshooting & Debugging Errors :

Been Lovable asks you for any such API link like this -

Let me fix all these. First, I'll need to add the RESEND_API_KEY for emails:

💡 1 tool used

Show all

I need to add the RESEND_API_KEY for email sending. Let me fix all issues now:

Add Secret ⓘ

RESEND_API_KEY

Submit

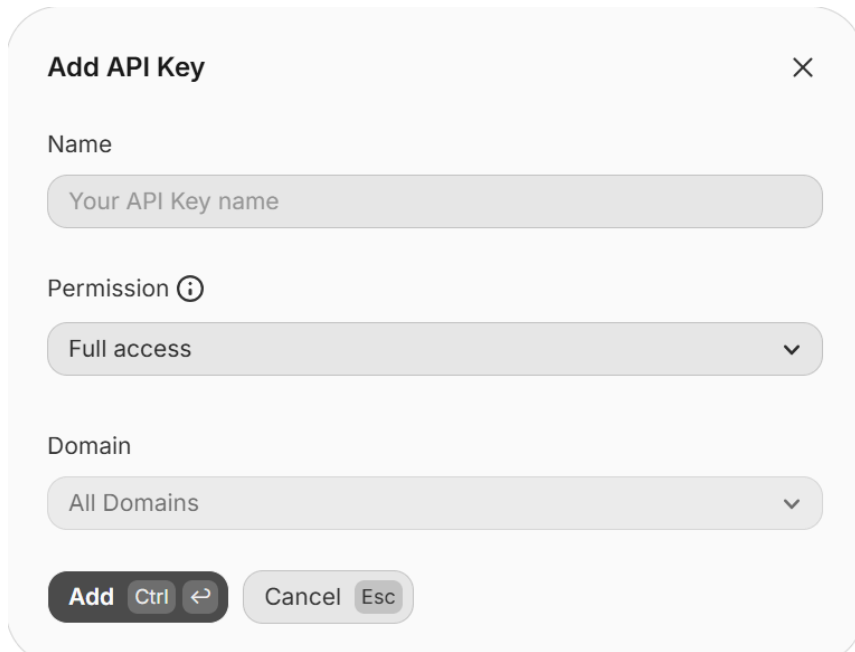

Secrets ⓘ

Then Follow the steps below :

Where to find the RESEND_API_KEY

1. Go to <https://resend.com>
2. Log in (or create a free account)
3. On the left sidebar → click **API Keys**
4. Click “**Create API Key**”
5. Copy the generated key (it starts with `re_...`)

Upon clicking on “**Create API Key**”, you will get this -

**Step 1 — On this screen, type a name**

You can enter anything. This is just a label so you know what the key is for.

Step 2 — Leave “Full access” (default)

No need to change it unless you want restrictions.

Step 3 — Leave Domain = All Domains

Unless you want domain-specific restrictions (you don't need this now).

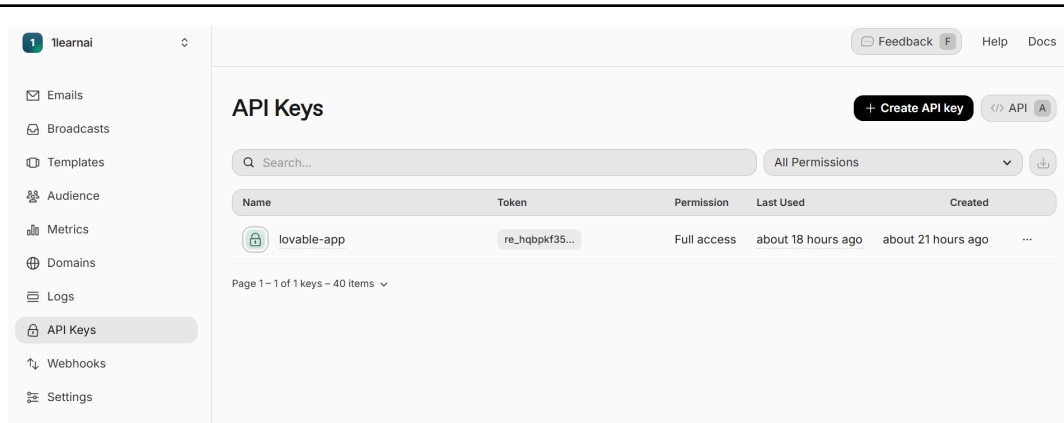

Step 4 — Click the black “Add” button

After you click **Add**, Resend will show you:

➡ **A generated API key — starting with `re_...`**

⚠ IMPORTANT :

You will only see the key *once*. Copy it immediately.
If you miss it, you can delete this key and create a new one.

Tip

You only need to create the API key *once*.

If your app uses other services (like Stripe, Supabase, etc.), those may ask for their own API keys too.

Quick Note

What Stripe Actually Does (Simple Explanation)

Stripe handles payments so you don't have to store card details.
It keeps everything secure and connects automatically to your app.

Why We Use Test Mode First

You can simulate payments without spending real money.

Nothing Will Break

Payment testing in Test Mode is 100% safe.
