

Step 1

Check on the **top right corner** of your Lovable window beside the Publish button. You will find the GitHub icon which will show like the below screenshot.

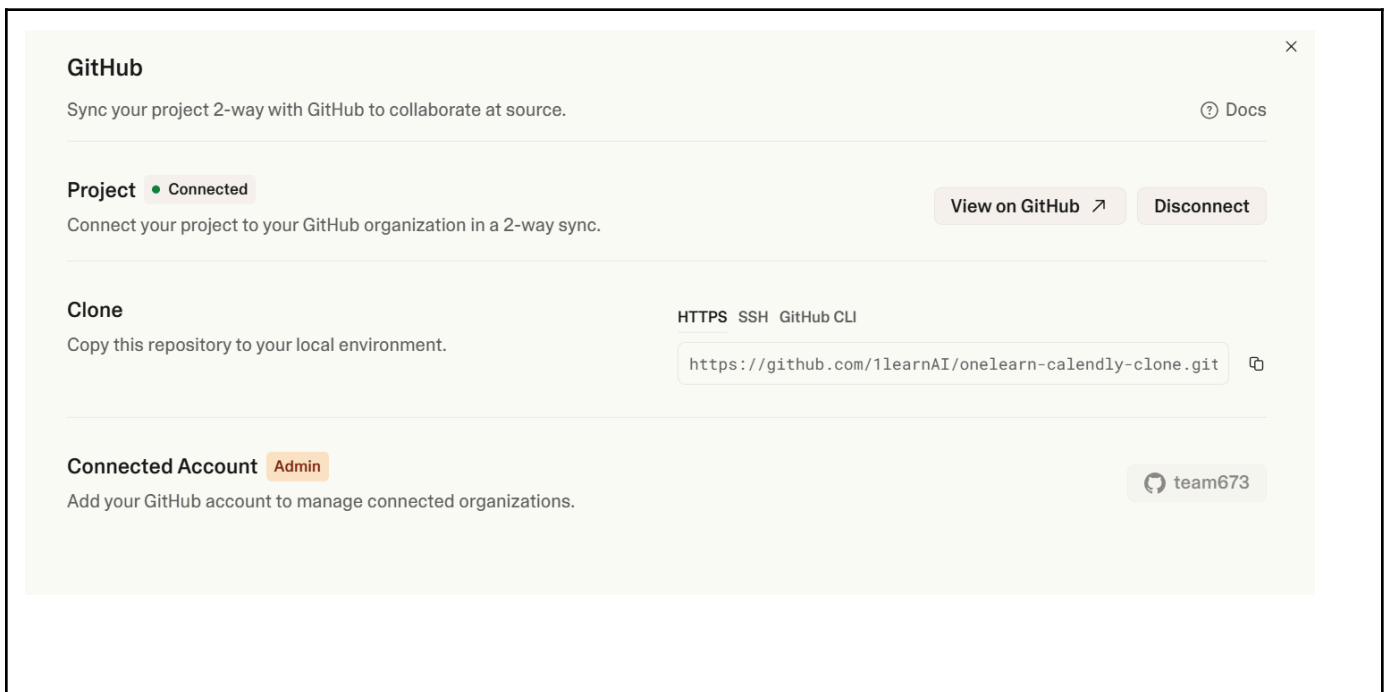

Clicking on it will open up a box like this

Click on **Connect Project** and Before that you should have your [Github](#) account set where you have created an Organization. Once you click on **Connect Project**, you will get the name of the organization you have created and simply click on that to follow the next steps and connect your Github account.

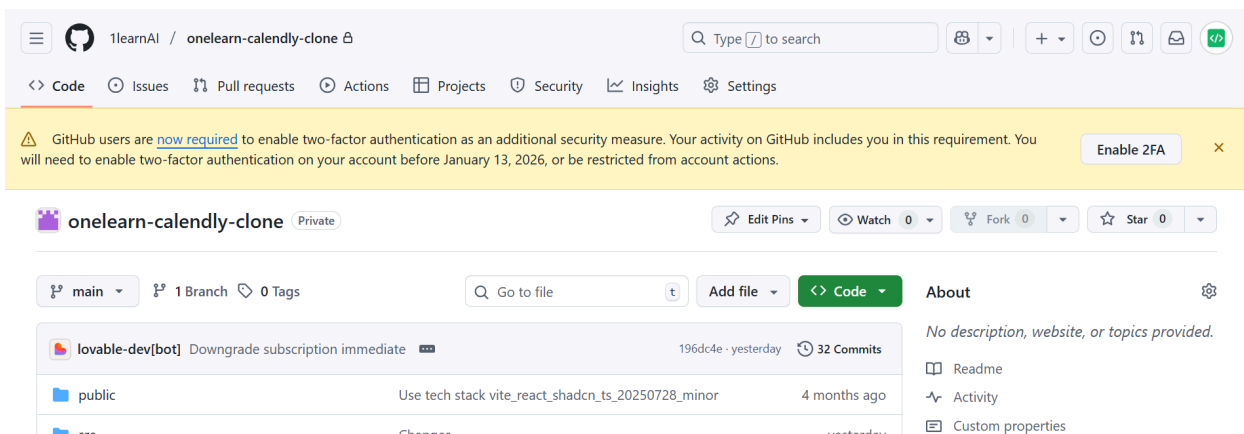

It'll look like this once connected →

Step 2 :

Click on “**View on GitHub**” to see how your repository is created and consists of the Projects you link or will link later.

It'll look like this -

When you click on the green button representing **Code**, you will get the link which says that you can use it for cloning and creating a similar application simply with that link and also you can download all the codes that were used to create the application that you connected with

GitHub, just by clicking on **Download ZIP**.

NOTE :

Lovable (or any similar no-code/AI builder) is a great place to create and experiment with your projects, but it is not ideal for professional hosting. Any application deployed directly from Lovable will display a badge indicating that it was created using Lovable, which may not look suitable in a professional or client-facing environment.

To host your application professionally, you should use a dedicated hosting platform like [Vercel](#). However, if you plan to use Vercel's free tier, make sure that your project's GitHub repository is set to **public**. Vercel does not allow deployments from private repositories on the free plan, so keeping your repo public is necessary to deploy without upgrading to a paid plan.

Steps to do that : -

Click on your Project name. Eg- "dark-task-mate" here

1learnAI / onelearn-calendly-clone

Go to Settings under that and scroll to the extreme bottom to find the Danger Zone

Danger Zone

Change repository visibility

This repository is currently public.

[Change visibility](#)

Disable branch protection rules

Disable branch protection rules enforcement and APIs

[Disable branch protection rules](#)

Transfer ownership

Transfer this repository to another user or to an organization where you have the ability to create repositories.

[Transfer](#)

Archive this repository

Mark this repository as archived and read-only.

[Archive this repository](#)

Delete this repository

Once you delete a repository, there is no going back. Please be certain.

[Delete this repository](#)

The first option shows **change repository visibility** beside which you have the option to change visibility. So click on that and follow the instructions to change your visibility to public IF you created it as a private project earlier.
